

# Publish your local files in GitHub.

You will create a new (public or private) repository on GitHub where your files are going to be uploaded: the name of the repository will match the name of your folder in VSCode.

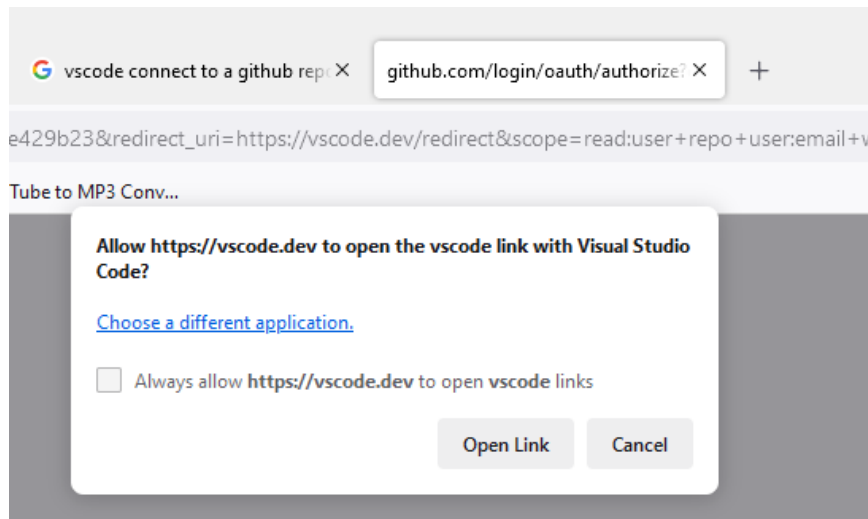

1. Log into your GitHub account
2. Create “project folder” in VSCode (here the folder is called “test”) and add some file(s) to it:

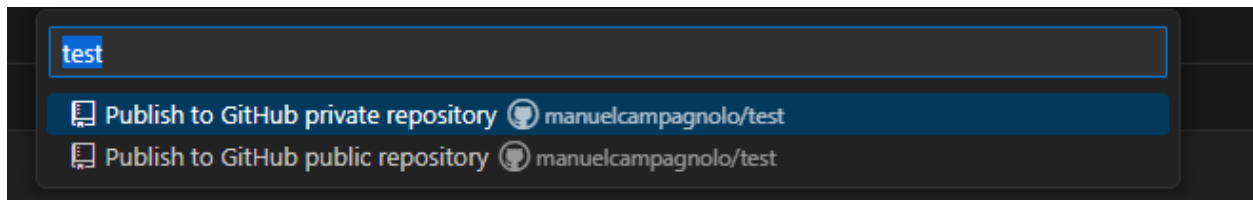

3. In the menu “Source Control”, press “Publish to GitHub”:

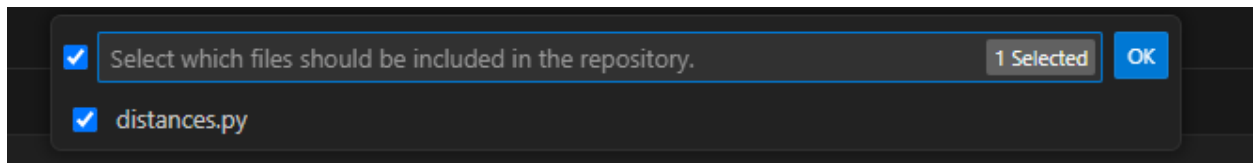

4. Authorize:

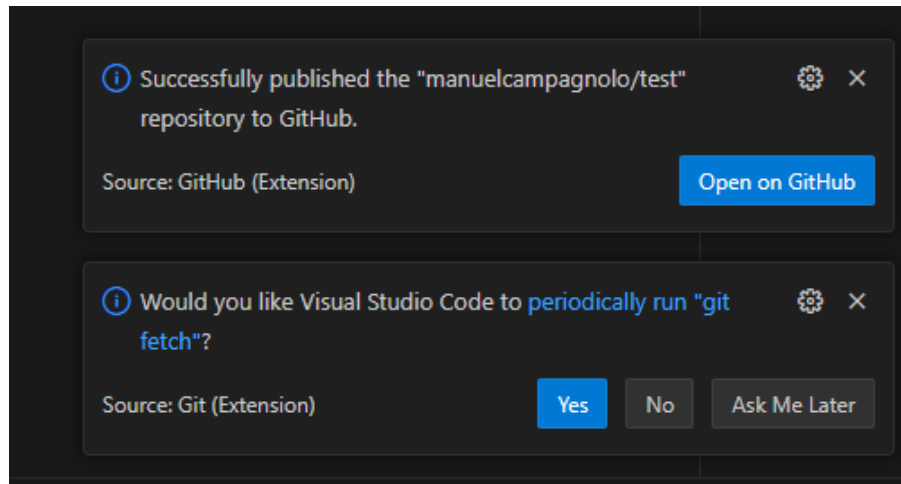

5. Choose Private or Public:

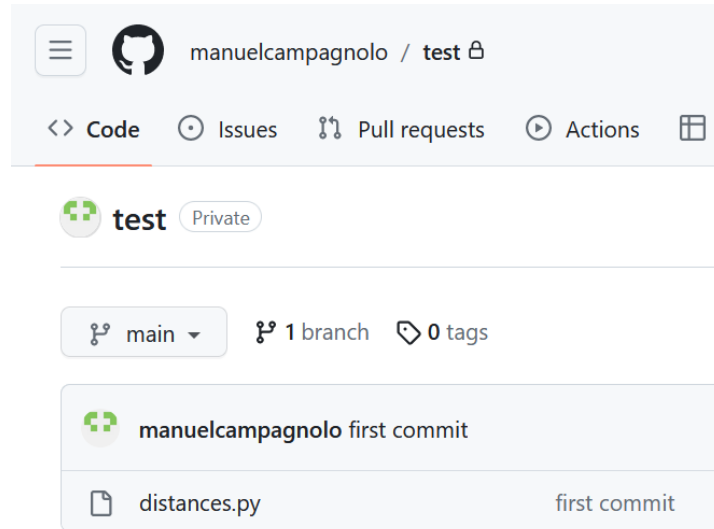

6. Choose files to publish and click OK

7. You should get the following message on VSCode

8. If you check your GitHub account, you should have a new repository and the files should have been copied to there:

9. At that point, you can see the connection in VSCode (down, near settings), where you can sign out if you want to disconnect
